Abstract

Continuously operated process for the intermediate isolation of the oxirane formed by  
10 reaction of a hydroperoxide with an organic compound in the oxirane synthesis,  
wherein the product mixture formed in the synthesis is fractionated in a dividing wall  
column to give a low-boiling fraction, an intermediate-boiling fraction and a high-  
boiling fraction and the oxirane is taken off in the intermediate-boiling fraction at the  
15 side offtake and the hydroperoxide is taken off in the high-boiling fraction at the  
bottom of the column.
